

# Image Steganography

# Hello!

Trần Đức Tuấn - HE150303

Tô Văn Đức - HE150402

Nguyễn Tấn Việt - HE153763

# Introduction

What is steganography?

“

**Steganography** is the art and science of embedding secret messages in a cover message in such a way that no one, apart from the sender and intended recipient, suspects the existence of the message

# Demonstration

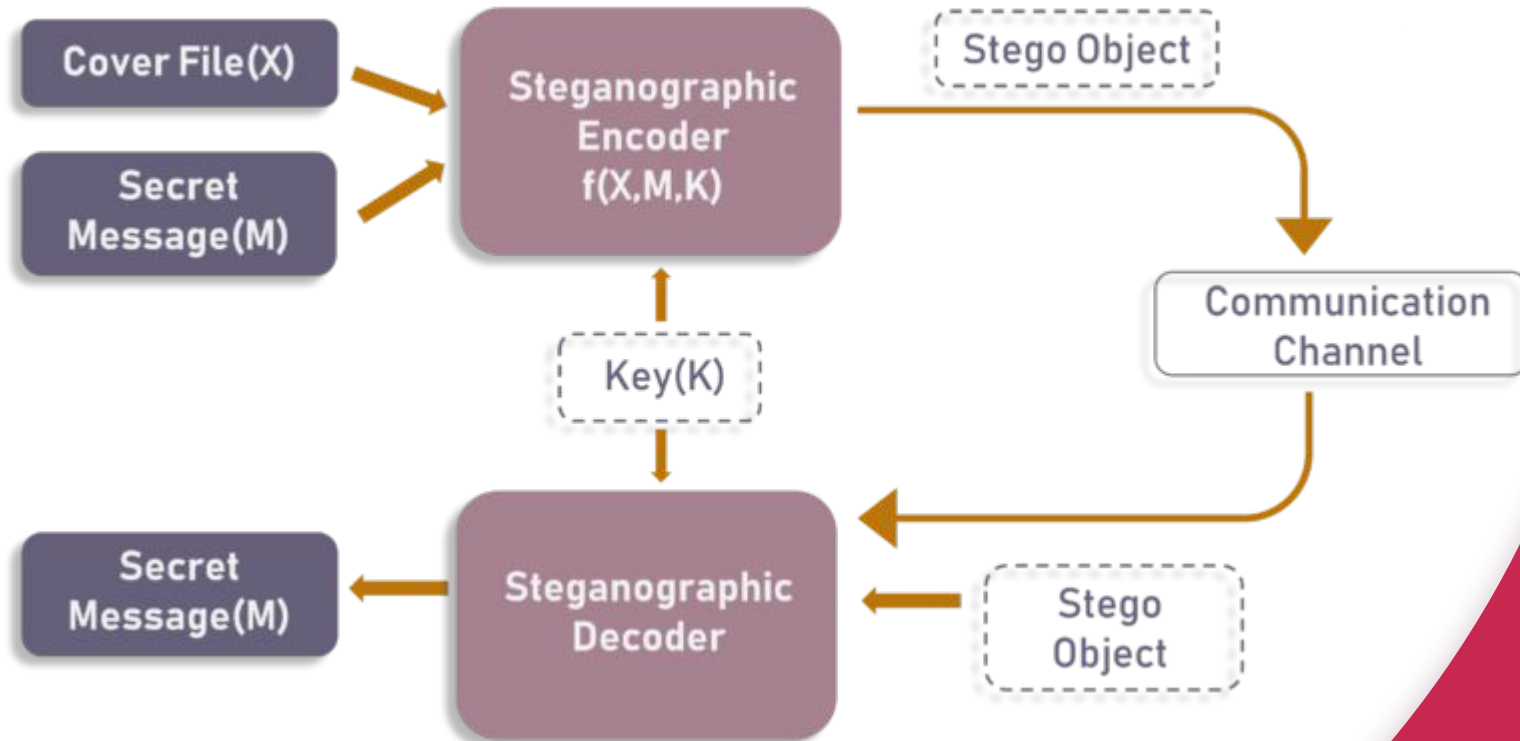

No Message

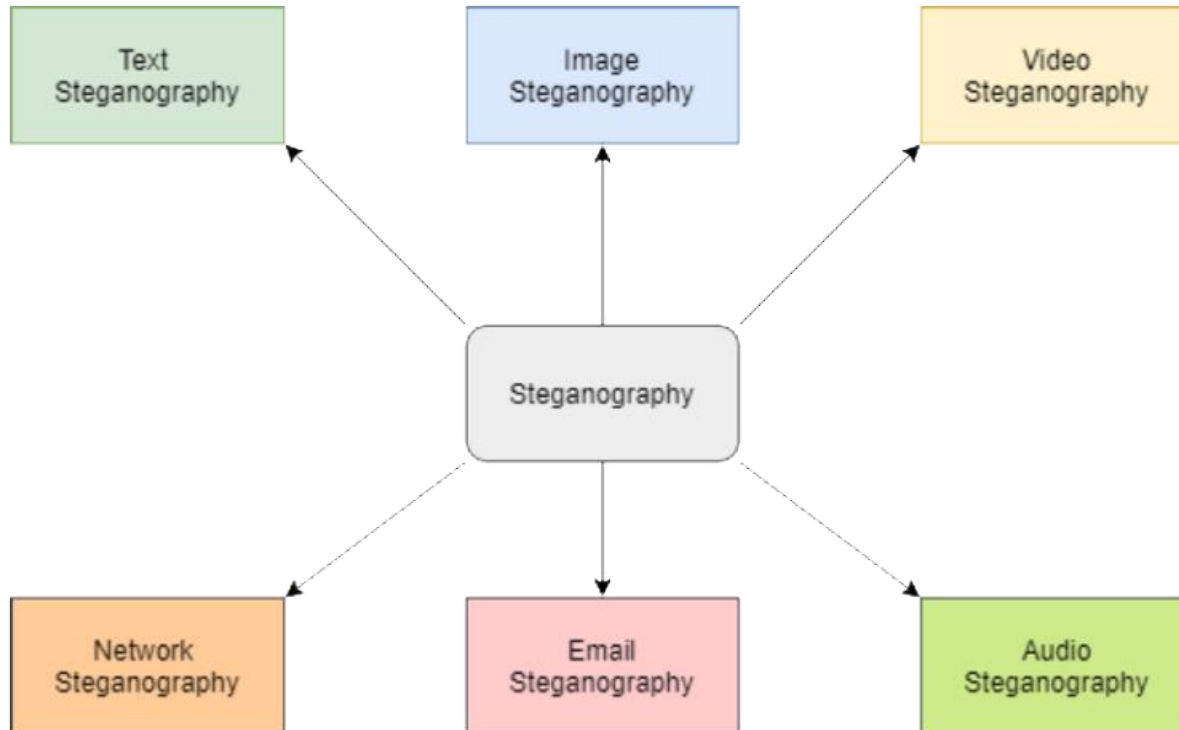

Attack at midnight

# Steganographic model

# Types of Steganography

# Steganography vs Cryptography

	STEGANOGRAPHY	CRYPTOGRAPHY
<b>Definition</b>	It is a technique to hide the existence of communication	It's a technique to convert data into an incomprehensible form
<b>Purpose</b>	Keep communication secure	Provide data protection
<b>Data Visibility</b>	Never	Always
<b>Data Structure</b>	Doesn't alter the overall structure of data	Alters the overall structure of data
<b>Key</b>	Optional, but offers more security if used	Necessary requirement
<b>Failure</b>	Once the presence of a secret message is discovered, anyone can use the secret data	If you possess the decryption key, then you can figure out original message from the ciphertext

# Applications

- Confidential communication
- Secret data storing
- Protect copyrights

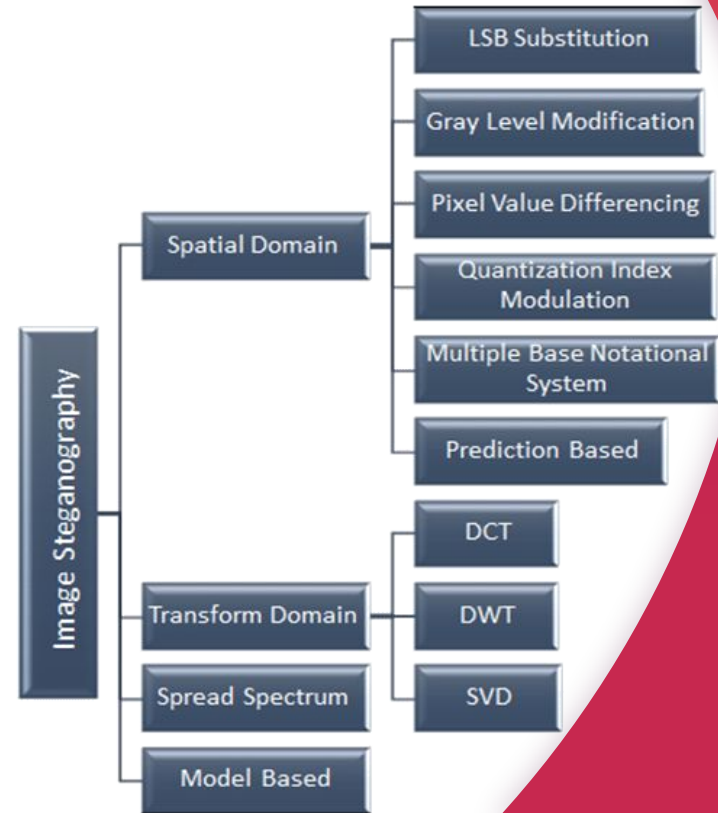

# Methods

LSB, LSBM, PVD...

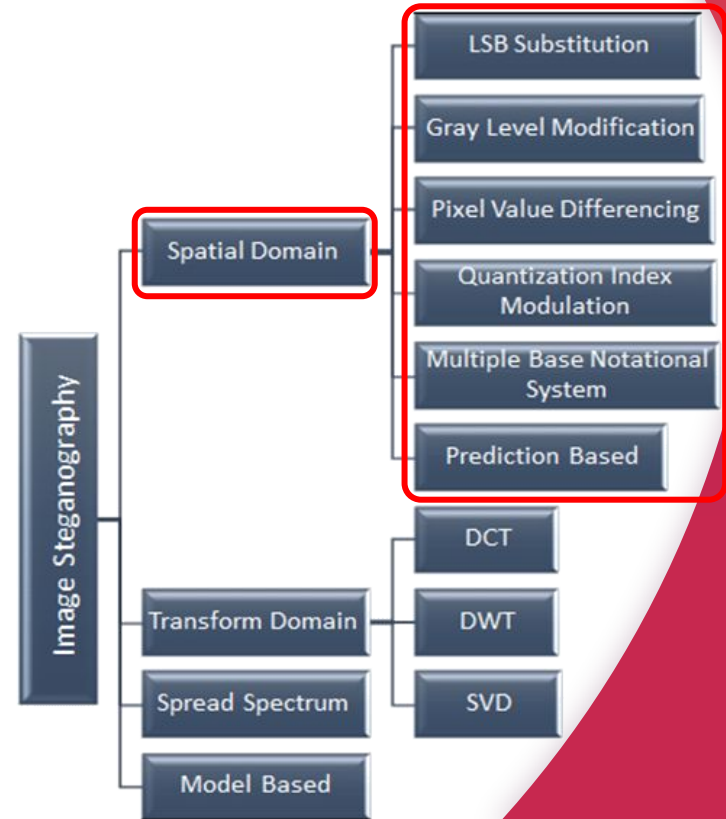

# Overview of groups of methods

- Spatial domain
- Transform domain
- Spread spectrum method
- Optimization method...

# Spatial domain

- Modifying secret message and cover image in spatial domain which involves embedding at level of least significant bits (LSB).
- E.g: LSB, LSBM

# Least Significant Bits (LSB)

Pixel

R

1	0	1	1	0	1	1	1
---	---	---	---	---	---	---	---

G

1	1	0	1	1	0	0	1
---	---	---	---	---	---	---	---

B

1	0	1	0	0	1	0	0
---	---	---	---	---	---	---	---

Total: 24 Bits

# Least Significant Bits (LSB)

Value: 255

1 1 1 1 1 1 1 1

Most Significant Bit(MSB)

Least Significant Bit(LSB)

255 1 1 1 1 1 1 1

127 0 1 1 1 1 1 1

Change in bytes is 99.99999%

1 1 1 1 1 1 1 1 255

1 1 1 1 1 1 1 0 254

Change in bytes is 0.000002%

# Least Significant Bits (LSB)

# Least significant bits matching (LSBM)

- Check matching between secret bit and LSB of cover image.
- If they does not match, then +1 or -1 added to the corresponding pixel value.

# Pixel-value Difference (PVD)

*A steganographic method for images by pixel-value differencing, Da-Chun Wu, Wen-Hsiang Tsai*

- Process 1x2 blocks.
- Use a list of *perceptibility ranges*.
- Sender and receiver agree upon a traversal order.

# Pixel-value Difference (PVD)

*A steganographic method for images by pixel-value differencing, Da-Chun Wu, Wen-Hsiang Tsai*

- Low capacity, highly imperceptible → narrower ranges and vice versa.
- Ex. using width list (8, 8, 16, 32, 64, 128):

Thus we can adjust the difference to

40

# Pixel-value Difference (PVD)

*A steganographic method for images by pixel-value differencing, Da-Chun Wu, Wen-Hsiang Tsai*

- Embed process:
  - Calculate the difference  $d = a_2 - a_1$ .
  - Get lower and upper bound  $l, u$  of that range.
  - Embedding capacity is  $\log_2(l - u + 1) = n$  bits.
  - Convert next  $n$  bits in stream to decimal number  $b$ .
  - Let the new diff. be  $d' = l + b < u$ .
  - Range check.
  - Replace  $(a_1, a_2)$  with  $(a_1', a_2')$  using:

$$f((a_1, a_2), m) = \begin{cases} (a_1 - \lceil m/2 \rceil, a_2 + \lfloor m/2 \rfloor) & \text{if } d \text{ is odd} \\ (a_1 - \lfloor m/2 \rfloor, a_2 + \lceil m/2 \rceil) & \text{if } d \text{ is even} \end{cases}$$

where  $m = d' - d$ .

# Pixel-value Difference (PVD)

*A steganographic method for images by pixel-value differencing*, Da-Chun Wu, Wen-Hsiang Tsai

- Extract process:
  - Calculate the difference  $d = a_2 - a_1$ .
  - Get lower and upper bound  $l, u$  of that range.
  - Embedding capacity is  $\log_2(l - u + 1) = n$  bits.
  - Range check.
  - Convert  $d - l$  to binary, pads to  $n$  bits and append to output.

# An adaptive PVD method

*Adaptive PVD Steganography Using Horizontal, Vertical, and Diagonal Edges in Six-Pixel Blocks, Sekhar et al.*

- Operate on 2x3 or 3x2 blocks → more embedding capacity.
- Adaptive in the sense that no fixed table is required, reducing step effect in pixel-difference histogram.

# An edge-based method

*Edge-based image steganography, Islam et al.*

If we apply LSB on a normal edge mask, there is a problem.

(d) if the difference using the same edge detector on cover and stego image.

(a)

(b)

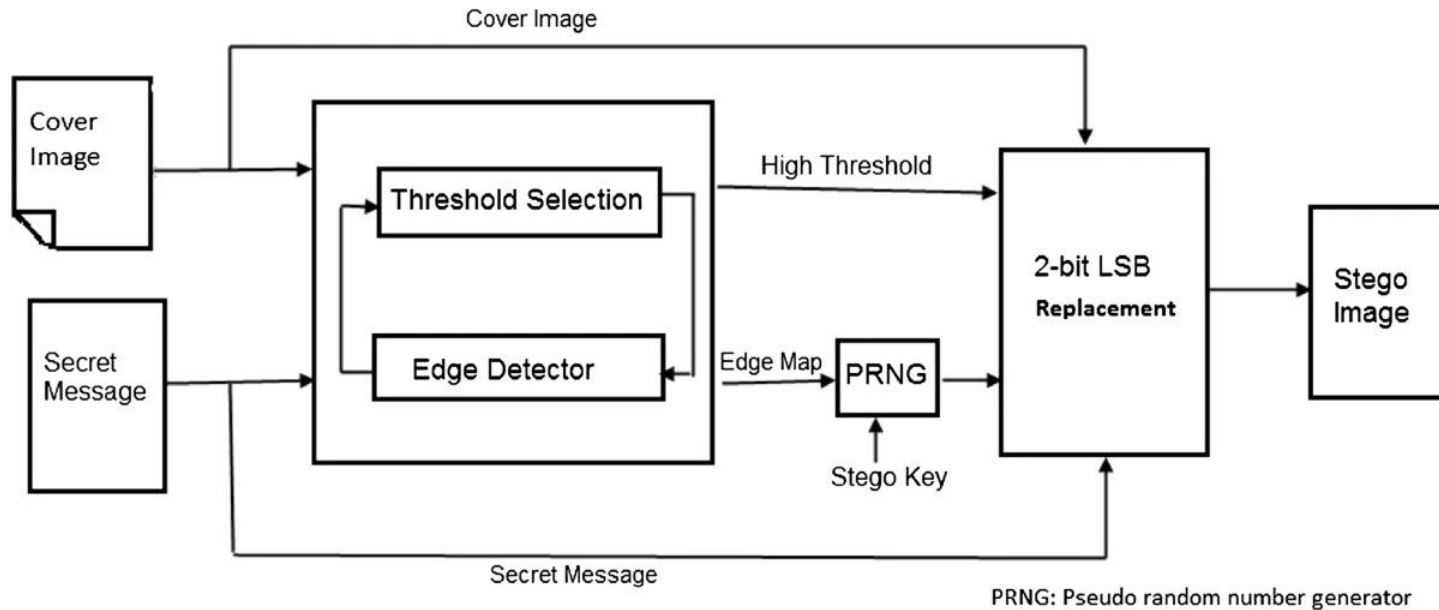

(c)

(d)

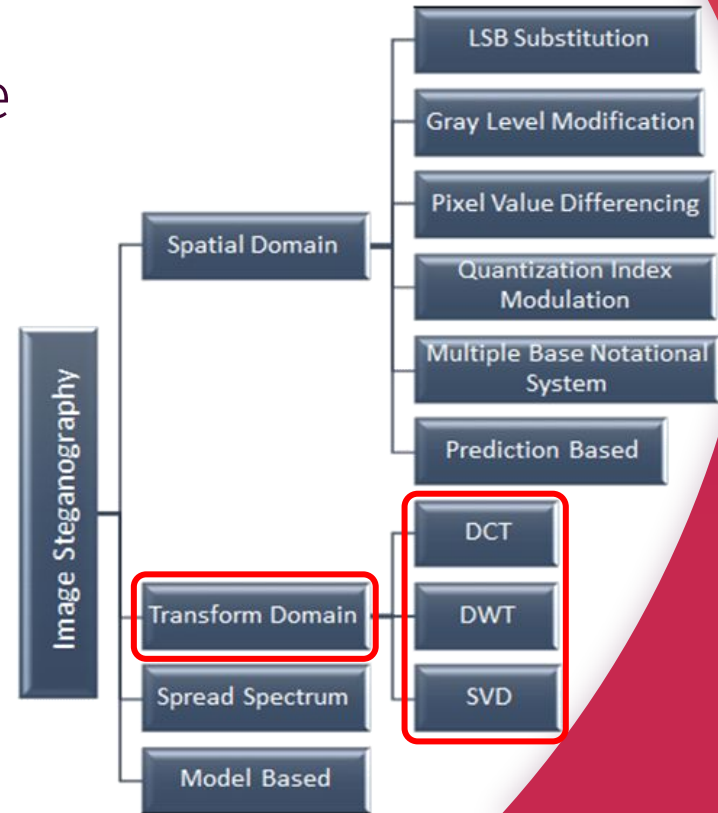

# An edge-based method

*Edge-based image steganography, Islam et al.*

# Transform domain

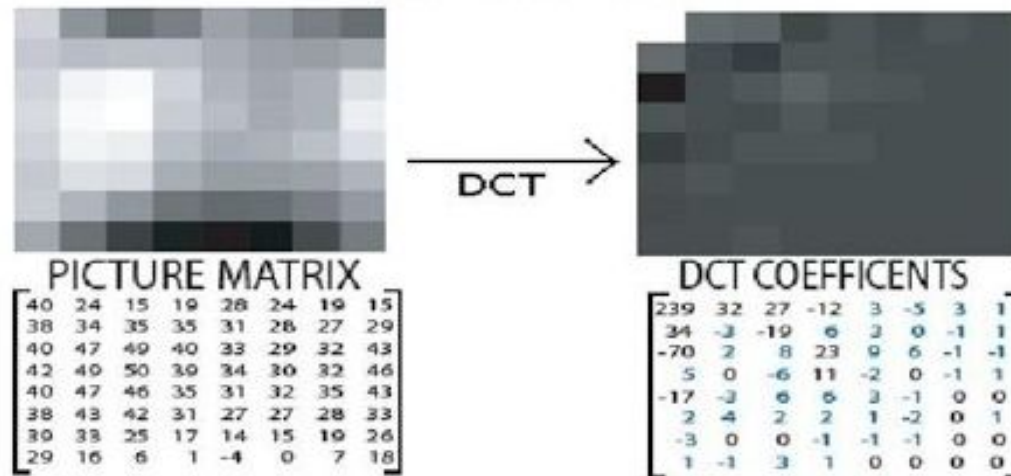

- Transform image from time domain to frequency domain
- Secret data is hidden in transform coefficients.
- E.g: Discrete cosine transform (DCT), discrete wavelet transform (DWT)

# DCT-based image steganography

- Closely relates to JPEG compression.
- DCT applied on each 8x8 blocks

# DCT-based image steganography

- Hide data in LSB after quantization.
- Receiver decode DCT coefficients and get the output from LSBs.
- Is part of the compression, but not resistant to unwanted compression.
- <https://github.com/lukechampine/jsteg>

# Our DCT-based method

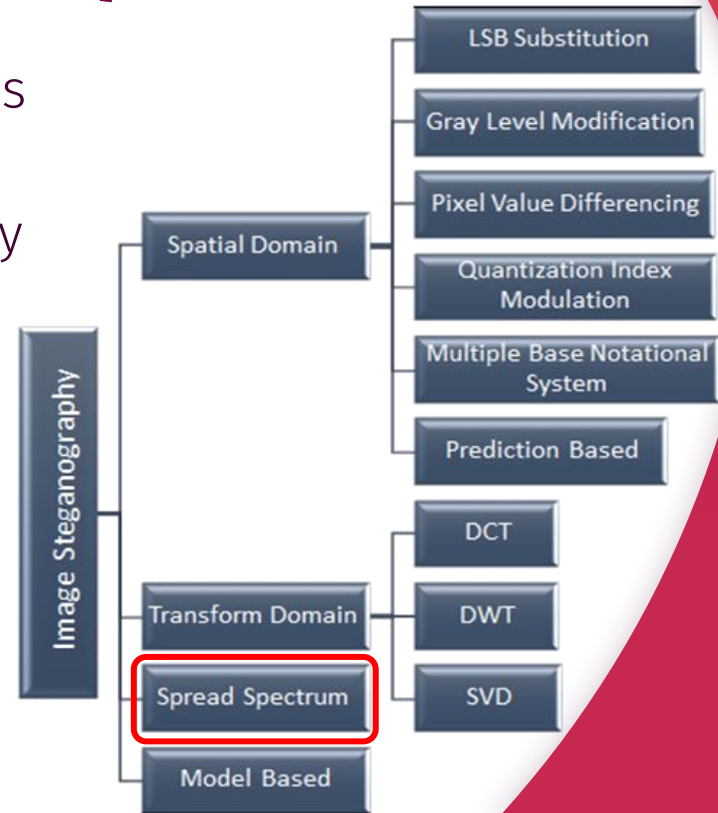

- Hide data in the  $n$ -th significant bit of DCT coefficients.
- The coefficient must be larger than a threshold.
- More resistant to accidental compression (e.g. through social networks).
- Tradeoff between resistance and image distortion.

# Our DCT-based method

- Problem: overflow rounding error after IDCT in near-0 and near-255 regions.
- Possible solution: employ a range check similar to PVD?

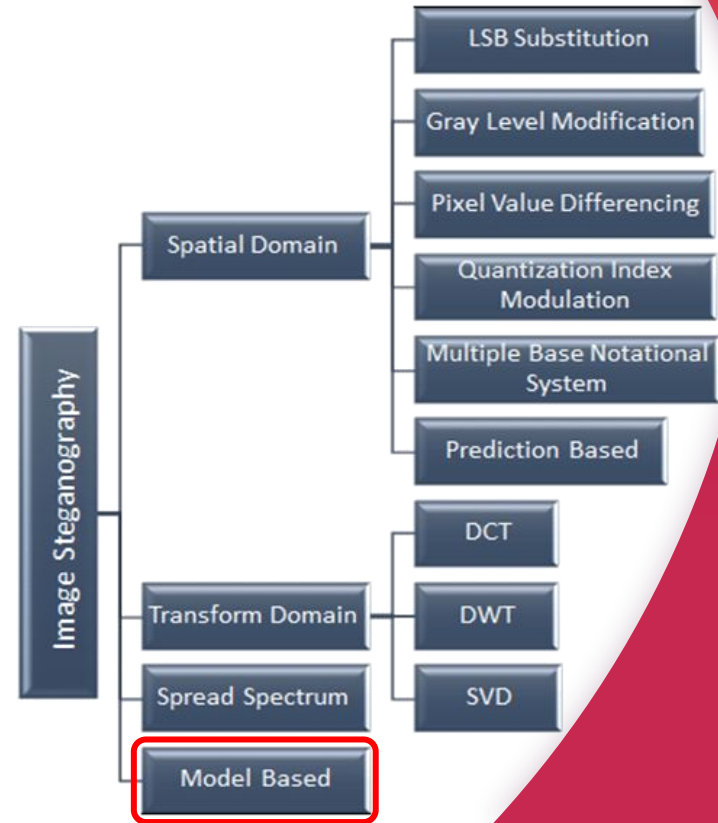

# Spread spectrum technique

- Spread narrowband signal across wideband signal.
- The energy of narrowband at any given frequency becomes low and hard to detect
- Data is embedded or hidden as noise to cover image (may be gaussian noise).
- Data is modulated with pseudorandom sequence and added to image.

# Optimization method (Model-based)

- Genetic algorithms (GA) and particle swarm optimization (PSO) are used in steganography.
- Optimized to find best starting point in spatial domain and directions, coefficients in transform domain.
- Hide secret message in those selected pixels.

# Demo

Embed & Extract message
